The Polish version of the Harvard Group Scale of Hypnotic Susceptibility, Form A (HGSHS:A; Shor & Orne, 1962) was administered to 1174 participants (968 women and 206 men). Polish data were compared with other norming studies. Point-biserial item-scale correlations ranged from $r = .12$ (posthypnotic suggestion item) to $r = .49$. The Kuder-Richardson correlation of $.70$ was within the range of the reference samples. Test-retest reliability coefficients were obtained from one group of participants tested twice in the same session ($r = .69$, $p < .05$), and another group 8 weeks apart ($r = .58$, $p < .05$). Females scored significantly higher than males.
