Hypnosis is making a comeback in all of the medical disciplines. But in a world where everyone wants to control everything and manage everything, it's helpful to know that hypnosis is a dynamic process that cannot be forced on anyone, a psychic reality, clearly demonstrated today by brain imaging. Hypnosis does not take any power over the individual. It is just one more tool to help ease patient's discomfort. It is also useful to avoid professional burnout to provide care without depleting our energy and without wasting our valuable time. Medical hypnosis is a real asset for providing comfortable orthodontic treatment and creating a serene atmosphere. It can be done simply and rapidly to take high quality impressions, to place braces comfortably on a patient who is sitting quietly. Orthodontic treatment requires cooperation and motivation, so let's give our patients a new sense of confidence and a willingness to cooperate.
